

WHAT IS CLAIMED IS:

1. A torqueable sheath which is insertable into a mammalian body and useable to rotationally position of the distal end of a catheter which has been inserted through
5 the sheath; said sheath comprising:

a pliable tubular sheath body having a proximal end, a distal end and a hollow lumen extending longitudinally therethrough, said tubular sheath body having sufficient torque strength to transfer torque
10 from the proximal end thereof to the distal end thereof, such that the distal end of the sheath body will rotate in substantial correlation with the proximal end of the sheath body;

a catheter engaging surface formed within the lumen of the sheath body, said catheter engaging surface being operative to engage the catheter when the catheter has been inserted through the sheath, such that i) the catheter will be prevented from rotating independently of the introducer sheath, but
15 ii) at least the distal end of the catheter will be caused to rotate in unison with the sheath.
20

2. The torqueable sheath of Claim 1 wherein said tubular sheath body is formed of a polymeric material having reinforcement members disposed therein to increase
25 the torque strength of said polymeric material.

3. The torqueable sheath of Claim 2 wherein said reinforcement members are formed into a braid.

4. The torqueable sheath of Claim 3 wherein said braid is formed of first and second groups of elongate members, each of said groups of elongate members being made up of a plurality of individual elongate members arranged in substantially parallel, side-by-side relation to one another, said first group being wound about the lumen of the sheath body in a clockwise direction, and said second
30 group being helically wound about the lumen of the sheath
35

09912122-072401

body in a counterclockwise direction, such that the elongate members of the first group cross with the elongate members of the second group at a plurality of cross-over locations, the individual elongate members of the first group being alternately passed over and under the individual elongate members of the second group at said cross-over locations, so as to form a tubular braid about the lumen of said sheath body.

5. An anchorable guide catheter which is insertable into a luminal anatomical structure, said guide catheter comprising:

a elongate catheter body having at least one lumen extending longitudinally therethrough;

an opening formed at a first location in said catheter body, in communications with said at least one lumen;

a pressure exerting member formed on said catheter body, said pressure exerting member being engageable with the luminal anatomical structure to prevent the first location of the catheter body from moving within the luminal anatomical structure.

6. The anchorable guide catheter of Claim 5 wherein said pressure exerting member is a balloon, and wherein said balloon is inflatable such that it will engage the luminal anatomical structure to prevent the first location of the catheter from moving within said luminal anatomical structure.

7. The anchorable guide catheter of Claim 6 wherein said balloon includes a friction enhancing treatment upon a surface of the balloon which engages the luminal anatomical structure.

8. The anchorable guide catheter of Claim 7 wherein said friction enhancing treatment on said balloon is selected from the group of friction enhancing treatments consisting of:

09912122.072401
104220.2221660

texturing;
adhesive; and,
woven fabric.

9. The anchorable guide catheter of Claim 5 further
5 comprising:

at least one engagement surface associated with
said first lumen, said at least one engagement surface
being operative to engage a second catheter which has
been inserted through said first lumen such that said
10 second catheter is thereby prevented from rotating
independently of said balloon-anchorable guide
catheter.

10. The anchorable guide catheter of Claim 9 in
combination with at least a) an imaging catheter and b) a
15 passageway-forming catheter having a tissue-penetrating
element which is passable through the wall of the luminal
anatomical structure within which the balloon-anchorable
guide catheter is positioned, said anchorable guide
catheter being useable in conjunction with said imaging
20 catheter and said passageway-forming catheter to form said
passageway through the wall of the luminal anatomical
structure, at a predetermined location, by the following
steps:

i) transluminally advancing the guide catheter
25 into said luminal anatomical structure until the
opening of the guide catheter is near the location on
the luminal anatomical structure through which said
passageway is to be formed;

ii) inserting the imaging catheter into a lumen
30 of the guide catheter such that the imaging catheter
will image anatomical structures which are in
alignment with the opening of the guide catheter;

iii) moving the guide catheter until the image
obtained by the imaging catheter indicates that the
35 opening of the guide catheter is in alignment with the

0912122-072401

site at which the extravascular passageway is to be formed;

5 iv) causing the pressure exerting member to engage the luminal anatomical structure 10 as to hold the first location of the guide catheter in substantially fixed position;

v) removing the imaging catheter from the first lumen of the guide catheter;

10 vi) inserting the passageway-forming catheter into a lumen of the guide catheter such that the passageway-forming catheter engages the at least one engagement surface of the guide catheter;

15 vii) causing the tissue-penetrating element to pass out of the passageway-forming catheter, through the opening of the guide catheter, and through the wall of the luminal anatomical structure, thereby forming said passageway.

18. The anchorable guide catheter of Claim 7 wherein the pressure exerting member is an inflatable balloon, and
20 wherein the step iv) comprises inflating the balloon such that the balloon will engage the luminal anatomical structure.

19. In a passageway-forming catheter of the type having i) an elongate catheter body and ii) a tissue-penetrating element which is advanceable out of a first
25 location on the elongate catheter body so as to pass through the wall of a luminal anatomical structure and to a target location in which said catheter is positioned, and iii) an imaging means which is useable to image the target
30 location, the improvement comprising:

a marker formed on said catheter at a second location, said second location being positioned relative to said imaging means and said first location, such that when the position and rotational
35 orientation of the catheter is adjusted such that said

099121221660

marker is aimed at said target location, said tissue penetrating element will penetrate through the wall of the luminal structure and into said target location.

13 10. The catheter of Claim 9¹² wherein said marker
5 comprises:

14 a U-shaped member mounted on said catheter.

11. The catheter of Claim 9¹² wherein said marker
comprises:

an elongate, generally rectangular member mounted
10 / on said catheter.

12. The catheter of Claim 9¹² wherein said marker
comprises:

14 a elongate wire mounted on said catheter.

13. The catheter of Claim 9¹² wherein said marker
15 comprises an arcuate member attached to and extending
distally from the distal end of the catheter body, said
arcuate member being disposed in a plane which is
substantially perpendicular to the path of the tissue-
penetrating element.

14. The catheter of Claim 9¹² wherein said marker
20 comprises a tripod member mounted on the distal end of the
catheter, said tripod member having first second and third
legs attached to said catheter and to one another, at least
one of said legs being in alignment with the path of the
25 tissue penetrating element.

15. The catheter of Claim 9¹² wherein the imaging means
comprises an elongate imaging lumen which extends
longitudinally through the catheter body and into which an
imaging apparatus is insertable and positionable so as to
30 obtain an image of said marker and said target anatomical
structure.

16. The catheter of Claim 15¹⁸ wherein said imaging
lumen extends longitudinally through the catheter and opens
through an outlet aperture in the distal end of the
35 catheter, and wherein said imaging apparatus is advanceable

09912122.072401

through said lumen such that the imaging apparatus protrudes out of and extends beyond the distal end of the catheter.

18
✓ 17. The catheter of Claim 15 wherein said imaging
5 lumen extends longitudinally through said catheter and
wherein an imaging window is formed at a second location on
said catheter such that an imaging apparatus may be
advanced through said imaging lumen and utilized to obtain
an image of said marker and said target anatomical
10 structure, through said imaging window.

✓ 18. The catheter of Claim 17 wherein said catheter
further comprises:

15 a flexible tip member mounted on the distal end
of the catheter, said flexible tip member having a
hollow passageway extending longitudinally
therethrough, and wherein said marker comprises an
elongate member attached to said catheter body and
extending through at least a portion of the hollow
passageway formed in said elongate member.

20 ✓ 19. The catheter of Claim 18 wherein said hollow
passageway has a first diameter, and wherein said elongate
member has a second diameter smaller than said first
diameter, such that a gap surrounds said elongate member
within said hollow passageway.

25 ✓ 20. The catheter of Claim 19 wherein said elongate
member protrudes beyond the distal end of said distal tip
member.

✓ 21. The catheter of Claim 20 wherein said marker
comprises:

30 a notch formed within said catheter and
surrounded by a plurality of strut members, said
imaging means being positionable within said notch,
and at least one of said strut members being useable
as said marker.

35 ✓ 22. The catheter of Claim 21 wherein said strut

09012122.072401

members comprise elongate wires attached to said catheter body and extending over said notch.

24 23. The catheter of Claim 21²⁴ wherein said notch comprises a region which is cut away from said catheter body such that there is defined a proximal catheter body portion proximal to said notch, and a distal catheter body portion distal to said notch.

24 24. The catheter of Claim 23²⁴ wherein an imaging catheter lumen extends longitudinally through said catheter body, and wherein said imaging means comprises an imaging catheter which is advanceable through said imaging catheter lumen and into said notch such that the image received by said imaging catheter includes the image of said at least one strut member which is useable as said marker.

25 25. The passageway-forming catheter of Claim 2¹² wherein said marker is a signal-emitting component which emits a signal which may be detected by said imaging means.

26 26. The passageway-forming catheter of Claim 25²⁸ wherein said energy-emitting component is a piezoelectric crystal.

30 27. The catheter of Claim 9¹² wherein the distance from said first location on said catheter to said target anatomical structure is known, and wherein said marker further comprises:

a plurality of distance-specific marker locations, each said distance-specific marker location being correlated to a known distance from said first location on said catheter to said target anatomical structure, said imaging means being thereby useable to position a selected one of said distance-correlated markings in alignment with the image of said target anatomical structure, thereby placing the catheter in optimal position and orientation to cause said tissue-penetrating element to form the desired passageway to

105912122-072401

said target anatomical structure, without extending beyond said target anatomical structure.

31 28. A system for positioning/aiming a passageway forming catheter which comprises an elongate catheter body having a tissue-penetrating element passable out of said catheter body in a lateral direction so as to create an interstitial passageway through the wall of the luminal anatomical structure within which the catheter is inserted into a target anatomical location, said apparatus comprising:

an emitting component which causes a signal to be emitted from said target anatomical location; and,

a receiving component which receives said signal from said anatomical location;

one of said emitting and receiving components being located at a fixed position relative to the path which will be followed by said tissue penetrating element as said tissue penetrating element passes out of said catheter, and being thereby useable to position and orient said catheter such that said tissue-penetrating element will create the desired interstitial passageway into said target anatomical location.

32 29. The system of Claim 28³¹ wherein said emitting component and said receiving component are both located on said passageway-forming catheter.

33 30. The system of Claim 28³¹ wherein one of said emitting component and said receiving component is located at said target anatomical location, and the other thereof is located on said passageway-forming catheter.

34 31. The system of Claim 28³¹ wherein said emitting component comprises an energy-emitting member which emits a form of energy selected from the group of energy forms consisting of:

35 sonic energy;

00912122.072401

ultrasonic energy;
light energy;
laser light energy;
radio frequency energy;
5 an electromagnetic signal;

and wherein said receiving component comprises a sensor adapted to receive said form of energy.

32. The system of Claim 28 wherein said emitting and receiving components are respectively positioned such that, 10 when said emitting and receiving components are brought into direct alignment to direct alignment with one another, the passageway-forming catheter will be properly positioned to cause said tissue-penetrating element to pass from said passageway to forming catheter into said target anatomical 15 location, and wherein said system further comprises:

apparatus for monitoring the intensity of the signal received by the receiving component, such that one may determine when the signal received by the receiving component has been peaked, thereby 20 indicating that the emitting and receiving components have been brought into direct alignment with one another and the catheter is correctly positioned and oriented.

33. The system of Claim 32 wherein said apparatus for 25 monitoring the intensity of the signal received by the receiving component comprises in series:

a signal conditioning and filtering component;
a rectifier;
a leaky integrator;
30 a analog to digital converter; and,
a display adapted to display the strength of the signal received by the receiving component.

34. The system of Claim 28 wherein said emitting component comprises an elongate pliable wire having an 35 emission-preventing shield formed laterally about the

09912122-072401

length of the wire, with the distal tip of the wire extending out of and beyond said shield such that energy may be emitted by only the distal tip of the wire.

35. The system of Claim 28 adapted for use in a procedure wherein the passageway-forming catheter is transluminally advanced into a first blood vessel for the purpose of forming a passageway through the wall of said first blood vessel and into said target anatomical location, and wherein one of said emitting and receiving components is insertable into said target anatomical location and the other thereof is mounted on said passageway-forming catheter.

36. A system for forming an interstitial passageway which extends through the wall of a luminal anatomical structure, said system comprising:

a) a deflectable catheter having an elongate pliable catheter body, a distal end, at least one lumen extending longitudinally through the catheter body, and a distal end opening through which said lumen opens at the distal end of said catheter body, a portion of said catheter body immediately adjacent the distal end thereof being alternately moveable between:

i) a straight configuration; and,
ii) a curved configuration;

b) an imaging apparatus which is insertable through at least a portion of said at least one lumen of said deflectable catheter to provide an image of at least the luminal anatomical structure when said deflectable catheter is inserted into said luminal anatomical structure; and,

c) a tissue-penetrating element which is advanceable through said at least one lumen of said catheter and out of said distal end opening such that, when the distal portion of the catheter is in its

05912122-072401

curved configuration within said luminal anatomical structure, the tissue-penetrating element will pass out of said distal end opening and through the wall of said luminal anatomical structure.

5 ~~37~~. The system of Claim ~~36~~³⁹ wherein said catheter further comprises:

10 a marker formed on said catheter at a first location, said marker being positioned at a known location on said catheter and being imangible by said imaging apparatus when said imaging apparatus is inserted into said at least one lumen of said catheter, said marker being thereby useable to facilitate selected rotation orientation of said catheter within said luminal anatomical structure such that, when the distal portion of the catheter is moved to its curved configuration, the distal opening of the catheter will be aimed at a desired location on said luminal anatomical structure.

15 ~~38~~. The system of Claim ~~36~~³⁹ wherein said system further comprises:

20 d) a passageway modifying apparatus which is passable through said at least one lumen of said catheter and out of said distal opening, said passageway modifying apparatus being useable to modify a passageway which has been initially formed by said tissue-penetrating element.

25 ~~39~~. The system of Claim ~~38~~⁴¹ wherein said passageway modifying apparatus is selected from the group of passageway modifying apparatus consisting of:

30 an apparatus for closing said passageway;
an apparatus for stenting said passageway;
an apparatus for enlarging said passageway;
an apparatus for cauterizing said passageway;
an apparatus for placing a channel connector
35 within said passageway;

09042122.072401

an apparatus for blocking the lumen of an anatomized conduit on either side of said passageway to effect flow through said passageway.

43/ 40. The catheter of Claim ¹² 9 wherein the marker is
5 formed of material which is reflective of energy which is received by the imaging means for the purpose of forming the image.

44/ 41. The catheter of Claim ¹² 9 wherein the marker is
10 formed of material which is partially internally reflective of energy which is received by the imaging means for the purpose of forming the image.

45/ 42. The catheter of Claim ¹² 9 wherein the marker is
15 formed of material which is absorptive of energy which is received by the imaging means for the purpose of forming the image.
